Subject:

In regards to the Humboldt Wind Energy Project,
While reading the Draft EIR, I noticed that there is no mention of the Foothill yellow-legged frog . The species breed in various places from April to June. I am concerned that by not taking this species into consideration, there is potential to disrupt there sexual reproductive behavior. Any number of outcomes could then result from such a disturbance, such as: decrease in species yield or increase in food source such as algae, moths, ants, grasshoppers, hornets, beetles, flies, water striders, and snails. I am concerned that such a disruption in the food chain will have a negative effect on the ecosystem.
Best
