Subject: wind project

Humboldt Wind Project Planner

I am wondering if you have thought about the legal ramifications of a fire started by those pesky wind turbines. At a hub height of 400 feet, an ember from a burning turbine can travel a good distance. And yes, they do catch fire. Catching grass and brush on fire, The wind (after all this is why the turbines are in this location) will fan the fire and start a serious fire. If it gets totally out of control who is going to pick up the tab for the destruction? You may say "Terra Gen". But if it's bad enough they will declare bankruptcy . Remember, They, and their corporate overlords are both LLCs ... limited liability corporations. They as individuals, can not be sued. Unless per haps it is written into the contract that they agree personally and severally to accept that responsibility. (and good luck with that)!

I would suggest that we say "thanks, but no thanks" to Terra Gen.
