5/3/19

Putting turbines in the water column and killing fish, and putting turbines in the air and killing birds, is basically the same thing.

We need to learn from history and not regret our actions when it is too late.
We are on the verge of launching yet more bird and bat eating blades into our air column.

Weeks and months and years go by while we study damage mitigation, meanwhile the animal populations are getting decimated.

And without significant remedies, more wind farms are in the works, both onshore and offshore.

Now we are on the verge of potentially wiping out the albatross, murrelets, puffins, frigate birds, terns, and pelicans, some of whom circumnavigate the globe with their ancient and historic flights.

We will look back at our eagerness to prevent one environmental problem at the expense of the irreversible loss of species, and ask ourselves why we made the birds the salmon of this era.

Our children will condemn us for being so stupid.
We need to look at the big picture. Wind turbines are not the answer.

Sometimes one big problem needs many small solutions.

Wave carpets, thermal energy, solar...

There is unharnessed energy basically everywhere in our daily existence. It's up to us to use all of it. It's time to modernize our approach to energy.

Turbines are appealing only because they sound cool. Nothing cool about them.
