

I have been studying the DEIR for the Terra-Gen Humboldt Wind Project and have many concerns which are too many to list.

My major concern is the speed with which this was created. I would think something of this magnitude would require years of study to create, yet it was put together and published for review in a very short time. This was possible because many of the topics which are required to have response have been deferred to some later time frame. Where are the geological studies reports for each of the locations. They are not included because the location of the generators have not been completed. Why is this? Also, the plan for the Jordan Creek access road is not completed yet this will have a major impact on Jordan Creek which is a salmon bearing stream.

My major reason for requesting that you reject this DEIR is that in reality, there should be at least three if, not four DEIRs surrounding this project. The Jordan Creek access road should require its own DEIR. The clear-cutting of 900 acres may only require a valid THP but I have never seen a THP issued for this size of harvest. This probably should require a DEIR because of its size. Another DEIR specifically for the wind generators should be required. This should be very complete with exact placement of each tower with a geological study of each location. Finally, the 100 foot wide by 24 mile long corridor for the transmission lines to the Bridgeville power transmission station is another major project. Stream protection, soil stabilization, vegetation control and fire prevention need to be thoroughly addressed. All of this must be included in a separate DEIR.

I217-1

None of these major concerns are satisfactorily addressed in this rapidly assembled, inconclusive and in some aspects, quite misleading DEIR. Therefore, I must request that you reject this DEIR in its entirety and require the owners of this proposed project thoroughly do the required investigations and report those findings in a complete DEIR.

I217-2

Thank you,

Jack Rogers
